

Shopify App Compliance & Billing Fix Report

Loom: Flash Sales & Discounts — Demotion/Delisting Response Guide

Prepared for: Adloom X / App Developer

App: Loom: Flash Sales & Discounts ([App Store](#)) | [GitHub Repo](#)

Reference: Shopify App Store Review #103713

Date: May 28, 2026

Deadline — Demotion: June 8, 2026 | **Deadline — Delisting:** June 17, 2026

Executive Summary

Shopify's App Excellence Team has flagged **6 compliance violations** across your live app that will trigger demotion on June 8 and delisting on June 17 unless resolved. The issues fall into three categories: **listing inaccuracies** (trial days mismatch, duplicate images), **broken core functionality** (offer creation error, subscription not recognized, store domain prompt), and **missing UX requirements** (no plan downgrade option, widget not displaying in storefront). All are fixable. This report details exactly what each violation means under Shopify policy, how to fix it in your codebase, and the full context of how Shopify billing works so you never hit these again.

Key Findings

- **Critical deadline:** You have ~11 days to fix and respond before demotion, ~20 days before delisting.
- **Billing mismatch is #1 priority:** Your listing says "3-day free trial" but the billing modal shows "7-day free trial" — a direct violation of §4.2.1. One line of code in your `appSubscriptionCreate` mutation fixes this.
- **Subscription detection is broken:** After subscribing, the app doesn't recognize the active plan — likely a missing or incorrect GraphQL query for `currentAppInstallation`. This blocks merchants from using paid features.
- **Plan downgrade is absent:** Your app must let merchants switch plans freely without contacting support — this is mandatory under §1.2.3.
- **Theme extension not rendering:** The countdown timer widget isn't visible in the storefront, making the core feature unusable for testing.
- **Duplicate listing image:** One screenshot appears twice — easy to fix but required for §4.4.5.
- **Store domain prompt is unexplained:** When clicking "View Plans," merchants are asked for their store domain. This needs to be removed or clearly justified.

Part 1: How Shopify App Billing Works

Understanding Shopify billing is mandatory to fix your compliance issues. Here's the complete model.

1.1 Two Billing Methods

Shopify supports two approaches for app monetization:

METHOD	DESCRIPTION	WHEN TO USE
Shopify App Pricing (recommended)	Plans defined in Partner Dashboard. Shopify hosts the plan selection page, automates trials, upgrades, downgrades, proration. No Billing API code needed.	New apps, or apps migrating off manual billing.
Manual Pricing (Billing API)	You use GraphQL mutations (<code>appSubscriptionCreate</code> , <code>appSubscriptionCancel</code>) to create charges. You build your own plan selection UI.	Legacy apps or apps needing custom billing logic.

Your app uses **Manual Pricing / Billing API**. The GitHub repo shows multiple billing-related commits (`billing hotfix` , `Fix billing configuration using lineItems` , `preserve remaining trial days when switching plans`), all pointing to manual Billing API usage.

Revenue share (2025 rules): - 0% on first **\$1,000,000 USD** gross annual revenue - 15% on earnings above \$1M - Plus a 2.9% payment processing fee on all transactions - You keep 100% of your first million every calendar year starting Jan 1, 2025

1.2 Subscription Lifecycle

```
Merchant installs app
↓
App calls appSubscriptionCreate (with trialDays, price, interval)
↓
Shopify returns confirmationUrl
↓
Merchant approves → Subscription becomes PENDING → ACTIVE
↓
Trial period runs (days specified in trialDays)
↓
First charge occurs after trial ends
↓
Billing cycle: every 30 days (EVERY_30_DAYS) or 365 days (ANNUAL)
↓
Upgrade/downgrade: cancel old subscription → create new one
↓
Proration: Shopify credits remaining days on upgrade automatically
```

1.3 The `appSubscriptionCreate` Mutation

This is the core billing call. Your code must match the trial days shown in your listing.

```
mutation AppSubscriptionCreate(
  $name: String!,
```

```

$lineItems: [AppSubscriptionLineItemInput!]!,
$returnUrl: URL!,
$trialDays: Int
) {
  appSubscriptionCreate(
    name: $name
    returnUrl: $returnUrl
    lineItems: $lineItems
    trialDays: $trialDays          # ← THIS must match your listing (3, not 7)
    replacementBehavior: STANDARD # Handles upgrade/downgrade
  ) {
    userErrors { field message }
    appSubscription { id status }
    confirmationUrl
  }
}

```

Variables for Basic Plan (3-day trial):

```

{
  "name": "Basic Plan",
  "trialDays": 3,
  "returnUrl": "https://your-app.com/billing/callback",
  "lineItems": [{
    "plan": {
      "appRecurringPricingDetails": {
        "price": { "amount": 9.99, "currencyCode": "USD" },
        "interval": "EVERY_30_DAYS"
      }
    }
  }]
}

```

1.4 Upgrade / Downgrade Flow

When a merchant switches plans, your app must: 1. Call `appSubscriptionCreate` for the new plan with `replacementBehavior: STANDARD` 2. Shopify automatically cancels the old subscription and handles proration 3. You do **not** need to manually call `appSubscriptionCancel` first

Proration rules:

- **Upgrade (monthly → higher monthly):** Immediate. Merchant charged the prorated difference.
- **Downgrade (monthly → lower monthly):** Takes effect end of current billing cycle. Credit issued.
- **Annual → Annual downgrade:** Deferred. No proration credit. New plan starts when current period ends.
- **Annual → Annual upgrade:** Immediate with proration credit.

1.5 Checking Subscription Status

To check if a merchant has an active subscription (this is where your app is broken):

```

query GetCurrentSubscription {
  currentAppInstallation {
    activeSubscriptions {
      id
      name
    }
  }
}

```

```

status
trialDays
currentPeriodEnd
lineItems {
  id
  plan {
    pricingDetails {
      __typename
      ... on AppRecurringPricing {
        price { amount currencyCode }
        interval
      }
    }
  }
}
}
}
}
}
}

```

This must be called in your **root loader** or on every protected route. If `activeSubscriptions` is empty, the merchant isn't subscribed.

1.6 Billing Cycle & Charges

- App subscriptions bill on a **30-day independent cycle**, separate from the merchant's Shopify billing cycle.
- If a merchant's Shopify account is frozen (non-payment), app subscriptions are also frozen.
- Free plan (no charge) requires no billing API call — just gate features in your app logic.

Part 2: Violation-by-Violation Fix Guide

Violation 1 — §4.2.1: Trial Days Mismatch (CRITICAL)

The issue: Your App Store listing shows **3-day free trial** on each paid plan. Your billing modal shows **7-day free trial**. These must match exactly.

Policy text: "Provide accurate and complete pricing information. Ensure your pricing information includes all pricing options such as free trial time and charge details."

Root cause in your code: Your `appSubscriptionCreate` call has `trialDays: 7` (or similar) hardcoded while your listing says 3. Look for this in your billing route (likely `app/routes/api.billing.jsx` or similar).

Fix:

```

// Find wherever you call appSubscriptionCreate
// Change trialDays to match your listing

const PLAN_CONFIG = {
  basic: { name: "Basic Plan", price: 9.99, trialDays: 3 }, // ← must be 3
  growth: { name: "Growth Plan", price: 19.99, trialDays: 3 }, // ← must be 3
}

```

```
pro: { name: "Pro Plan", price: 29.90, trialDays: 3 }, // ← must be 3
};
```

Alternatively, update your App Store listing to say "7-day free trial" on each paid plan — either way, they must be identical.

Where to change it in Partner Dashboard: 1. Partner Dashboard → Apps → Loom: Flash Sales & Discounts 2. Distribution → Manage listing → Edit (English) 3. Pricing content → Manage → Edit each paid plan's trial period 4. Save and resubmit

Violation 2 — §1.2.3: No Plan Downgrade Option (CRITICAL)

The issue: After subscribing to a higher plan, there is no option to downgrade. Merchants must be able to self-serve plan changes without contacting support.

Policy text: "Allow pricing plan changes. Your app must allow merchants to upgrade and downgrade their pricing plan without having to contact your support team or having to reinstall the app. This includes ensuring that charges are successfully processed in the application charge history page in the merchant admin."

Fix — Add a plan management UI:

Your app's settings/billing page must show all available plans and allow selection regardless of current plan:

```
// app/routes/app.billing.jsx (or similar)

export default function BillingPage() {
  const { currentPlan } = useLoaderData();
  const plans = [
    { id: "free", name: "Free", price: 0 },
    { id: "basic", name: "Basic", price: 9.99 },
    { id: "growth", name: "Growth", price: 19.99 },
    { id: "pro", name: "Pro", price: 29.90 },
  ];

  return (
    <Page title="Manage Plan">
      {plans.map(plan => (
        <Card key={plan.id}>
          <Text>{plan.name} - ${plan.price}/month</Text>
          {currentPlan === plan.id ? (
            <Badge>Current Plan</Badge>
          ) : (
            <Form method="post" action="/api/billing/change">
              <input type="hidden" name="plan" value={plan.id} />
              <Button submit>
                {plan.price > currentPlanPrice ? "Upgrade" : "Downgrade"}
              </Button>
            </Form>
          )}
        </Card>
      ))}
    </Page>
  );
}
```

```
);  
}
```

Backend action — create new subscription (replaces old one):

```
export const action = async ({ request }) => {  
  const { admin, session } = await authenticate.admin(request);  
  const formData = await request.formData();  
  const plan = formData.get("plan");  
  
  if (plan === "free") {  
    // Cancel existing paid subscription  
    await cancelCurrentSubscription(admin);  
    return redirect("/app");  
  }  
  
  const config = PLAN_CONFIG[plan];  
  const response = await admin.graphql(`  
    mutation AppSubscriptionCreate($name: String!, $lineItems: [AppSubscriptionLineItemInput!]!, $returnUrl: URL!,  
      appSubscriptionCreate(  
        name: $name  
        returnUrl: $returnUrl  
        lineItems: $lineItems  
        trialDays: $trialDays  
        replacementBehavior: STANDARD  
      ) {  
        confirmationUrl  
        userErrors { field message }  
      }  
    `, { variables: { name: config.name, trialDays: config.trialDays, returnUrl: `${process.env.SHOPIFY_APP_URL}/bill` }  
  
  const { confirmationUrl } = response.data.appSubscriptionCreate;  
  return redirect(confirmationUrl);  
};
```

Violation 3 — §2.1: Subscription Not Recognized After Subscribing (CRITICAL)

The issue: After subscribing to a plan, the app still doesn't recognize the active subscription and blocks access to paid features (specifically, choosing visual styles for the timer).

Root cause: Your app is likely checking subscription status incorrectly or using a stale/cached status. The subscription query must be done on every page load after billing.

Fix — Check subscription in root loader:

```
// app/routes/app.jsx (root app route loader)  
export const loader = async ({ request }) => {  
  const { admin, session } = await authenticate.admin(request);  
  
  // Always query live subscription status from Shopify  
  const subscriptionData = await admin.graphql(`
```

```

query GetSubscription {
  currentAppInstallation {
    activeSubscriptions {
      id
      name
      status
      trialDays
      currentPeriodEnd
      lineItems {
        plan {
          pricingDetails {
            __typename
            ... on AppRecurringPricing {
              price { amount currencyCode }
              interval
            }
          }
        }
      }
    }
  }
}
`;

const subs = subscriptionData.data.currentAppInstallation.activeSubscriptions;
const activeSub = subs.find(s => s.status === "ACTIVE" || s.status === "PENDING");

// Determine plan tier from subscription name
let planTier = "free";
if (activeSub) {
  if (activeSub.name.toLowerCase().includes("basic")) planTier = "basic";
  else if (activeSub.name.toLowerCase().includes("growth")) planTier = "growth";
  else if (activeSub.name.toLowerCase().includes("pro")) planTier = "pro";
}

return json({ shop: session.shop, planTier, activeSub });
};

```

Then gate features based on `planTier`:

```

// In any route that needs subscription check
const { planTier } = useRouteLoaderData("routes/app");
const isPaid = ["basic", "growth", "pro"].includes(planTier);

// For premium timer designs (Growth/Pro only)
const hasPremiumTimers = ["growth", "pro"].includes(planTier);

```

Also check: Your database (Prisma schema) — if you're storing plan status in a DB table, the DB record may not be getting updated after Shopify confirms the subscription. Make sure your `returnUrl` callback correctly updates the DB from the Shopify API response.

Violation 4 — §2.1: Offer Creation Error on Submit (CRITICAL)

The issue: Creating an offer throws an error after clicking Submit.

Likely causes: 1. A missing required field in the Shopify API call (e.g., a discount code creation mutation missing required params) 2. A Prisma/database error (foreign key constraint, missing relation) 3. A server-side crash not being caught and returned as a user-friendly error

Fix steps:

Step 1 — Add error logging to your offer action:

```
export const action = async ({ request }) => {
  try {
    const { admin } = await authenticate.admin(request);
    const formData = await request.formData();
    // ... your offer creation logic

  } catch (error) {
    console.error("Offer creation error:", error);
    // Return error to UI instead of crashing
    return json({
      error: error.message || "Failed to create offer. Please try again."
    }, { status: 500 });
  }
};
```

Step 2 — Check your Prisma schema for required fields:

```
// Check if all required fields are being passed
// Common issue: session/shop not being linked to the offer record
const offer = await db.offer.create({
  data: {
    shop: session.shop, // ← make sure this is included
    title: formData.get("title"),
    // ... other fields
  }
});
```

Step 3 — Check for Shopify API errors before the DB write:

Ensure discount/price rule creation via the Shopify API succeeds before writing to your DB. Wrap API calls and surface errors to the UI.

Violation 5 — §5.1.2: Theme App Extension Not Showing in Storefront (CRITICAL)

The issue: The countdown timer widget / app block is not visible in the storefront after following setup instructions.

Policy text: "Your app widget must be displayed properly and without any errors in the Theme Editor and Online Store."

Common causes and fixes:

Fix A — Enable development store preview:

Partner Dashboard → Apps → Loom: Flash Sales & Discounts → Extensions
→ Enable "Development store preview" for the countdown timer extension

Fix B — Redeploy the extension:

```
cd /path/to/adloom  
shopify app deploy
```

A Git push alone does NOT deploy theme extensions. You must run `shopify app deploy`.

Fix C — Verify `shopify.extension.toml` is correctly configured:

```
# extensions/countdown-timer/shopify.extension.toml  
name = "Countdown Timer"  
type = "theme"  
  
[theme]  
[[blocks]]  
name = "Countdown Timer Block"  
target = "section"
```

Fix D — Ensure the theme is Online Store 2.0 compatible: The test store must use a theme that supports app blocks (Dawn, Sense, Craft, etc.). Legacy themes don't support app blocks. Check: Online Store → Themes → Customize → Add block → look for "Apps" section.

Fix E — Verify the app block `schema` in `.liquid` file:

```
{% schema %}  
{  
  "name": "Countdown Timer",  
  "target": "section",  
  "javascript": "countdown-timer.js",  
  "stylesheet": "countdown-timer.css",  
  "settings": [...]  
}  
{% endschema %}
```

Fix F — Check for JavaScript errors in the browser console when the app block is added to a page. A JavaScript error will prevent rendering without an obvious UI error.

Violation 6 — §4.4.5: Duplicate Image in App Listing (EASY)

The issue: One screenshot appears twice in your app listing. Shopify flagged this via screenshot at the review link provided.

Policy text: "Each image in your app listing must be unique. Screenshots should showcase different features, views, or states of your app. Don't submit duplicate or near-identical images."

Fix: 1. Partner Dashboard → Apps → Loom → Distribution → Manage listing → Edit (English) 2. Go to the "Media" / screenshots section 3. Identify and remove the duplicate image 4. Replace it with a unique

screenshot showing a different feature (e.g., bulk price editor, coupon display, BOGO block, analytics dashboard, etc.)

Image requirements: - Exactly **1600px × 1200px** - Show actual app UI (not stock photos, not the Shopify admin homepage) - Each image must show a distinctly different feature or screen state

Violation 7 — Store Domain Prompt When Clicking "View Plans" (MEDIUM)

The issue: When a merchant clicks "View Plans" from the visual style selector, they're prompted to enter their store domain. Shopify's reviewer found this confusing and non-standard.

Root cause: Your app is likely redirecting to your plan page outside the embedded admin context, losing the shop session, and then asking for the domain to re-identify the merchant.

Fix: "View Plans" should redirect to your in-app billing route, not an external URL:

```
// Instead of opening an external URL:
window.open(`https://your-app.com/plans?shop=${shopDomain}`, "_blank"); // ❌

// Use App Bridge navigation to stay in embedded context:
import { useNavigate } from "@remix-run/react";
const navigate = useNavigate();
navigate("/app/billing"); // ✅ stays authenticated, no domain prompt
```

If you must use a confirmation URL from Shopify, it already contains the shop in the URL — don't add a separate domain collection step.

Part 3: Priority Order & Timeline

Given you have until **June 8** (demotion) and **June 17** (delisting):

PRIORITY	VIOLATION	COMPLEXITY	EST. TIME	DEADLINE
1	§4.2.1 — Fix trial days (3 not 7) in billing code	Low	1 hour	June 8
2	§2.1 — Fix subscription status check (broken plan recognition)	Medium	4–8 hours	June 8
3	§1.2.3 — Add plan downgrade option	Medium	4–8 hours	June 8
4	§2.1 — Fix offer creation error	Medium	4–8 hours	June 8
5	§5.1.2 — Fix theme extension not showing	Medium	2–4 hours	June 8
6	§4.4.5 — Replace duplicate screenshot	Low	30 min	June 8
7	Store domain prompt — fix navigation	Low	1–2 hours	June 8

Reply to Shopify's email immediately (today) acknowledging receipt and stating your fix timeline. This prevents auto-demotion and buys goodwill with the review team. Use the reference number: **103713**.

Part 4: Email Response Template

Send this to the Shopify App Store Team right now:

Subject: Re: Issues with Loom: Flash Sales & Discounts — Ref: 103713

Hi Shopify App Store Team,

Thank you for the detailed audit report (Ref: 103713). We acknowledge receipt and have begun prioritizing the fixes.

Our resolution plan: - **§4.2.1 (Trial days mismatch)**: Fixing `trialDays` parameter in billing code to match listing's 3-day trial. ETA: [DATE, within 2 days] - **§2.1 (Subscription not recognized)**: Fixing subscription status query in root loader. ETA: [DATE] - **§1.2.3 (No downgrade option)**: Adding plan management UI with upgrade/downgrade for all tiers. ETA: [DATE] - **§2.1 (Offer creation error)**: Debugging and fixing server-side error in offer submission. ETA: [DATE] - **§5.1.2 (Theme extension not showing)**: Redeploying extension and verifying storefront rendering. ETA: [DATE] - **§4.4.5 (Duplicate image)**: Replacing duplicate screenshot with unique feature image. ETA: [DATE] - **Store domain prompt**: Fixing navigation to use embedded App Bridge routing. ETA: [DATE]

We will reply again once all fixes are live for re-review.

Best regards,

[Your name] — Adloom X

Part 5: Ongoing Compliance — What to Never Break Again

Listing vs. Code parity rule

Every number in your App Store listing (trial days, price, feature limits) must exactly match what your code enforces. Treat your listing as a contract.

Subscription check architecture

Always query `currentAppInstallation.activeSubscriptions` from Shopify's API on every protected page load. Never rely solely on a local database cache for gating features — Shopify is the source of truth.

Theme extension deployment

Theme extensions are not deployed by a Git push. You must run `shopify app deploy` from the CLI every time you change extension files. Set this up as part of your deployment pipeline.

Plan change UX

Your app's settings/billing page must always show all plans with clear upgrade/downgrade CTAs. Never require a merchant to reinstall the app or contact support to change their plan.

Screenshot hygiene

Every listing image must be unique and show a distinct feature. Before submitting any listing update, manually review all images for duplicates.
